

Advantage of Lap Band System

Advantage of Lap Band System

The Lap Band System does not require any surgical cutting, stapling, or stomach re-routing that procedures such as gastric bypass involve. The focus is placed on a proven, minimally-invasive procedure, resulting in the patient receiving a faster result.

Unlike gastric bypass, patients who get the Lap Band System are not likely to experience difficulties absorbing vitamins or digesting food. The idea of the Lap Band System is to simply reduce one's capacity to eat, thereby allowing for weight declines and continued weight management.
